Project: University Student Portal

1. Introduction

1.1 Project Overview:

The University Student Portal is an interactive UI/UX project designed to help university students manage their academic activities efficiently. The complete interface and interactions are designed and prototyped using Figma, following core Human Computer Interaction (HCI) principles such as usability, consistency, feedback, and user control.

1.2 Purpose of the Project:

The main purpose of this project is to design a user-friendly, interactive, and well-structured student portal that allows students to easily access academic information and perform essential tasks.

1.3 Target Users:

University Students

2. Design Tools & Methodology

2.1 Design Tool

Figma (UI Design and Interactive Prototyping)

2.2 Design Methodology

- User-Centered Design (UCD)
- Interactive Prototyping
- Consistent layout and navigation
- Clear visual hierarchy

3. Navigation Structure

3.1 Menu Bar Design

A persistent menu bar is available on all screens, providing easy navigation through a drop-down menu.

Menu Options:

- Login
- Dashboard (Home)
- Courses
- Timetable
- Attendance
- Grades
- Announcements
- Enrollment
- Fee Management
- Profile
- Logout

4. Screen-Wise Description

4.1 Login Screen

- The login screen allows users to enter their credentials.
- On successful login, a “Login Successful” message is displayed.
- Incorrect input provides immediate error feedback.

HCI Principles Applied:

- Feedback
- Error prevention

4.2 Dashboard

- The dashboard serves as the home page of the portal.
- Provides an overview of important academic information
- Quick access to all major features

Dashboard screen:

4.3 Courses Screen

This screen displays all enrolled courses.

- Course name
- Course code

Courses screen:

4.4 Timetable Screen

The timetable screen shows the student's weekly class schedule.

- Day-wise and time-wise layout
- Easy-to-read format

Timetable screen:

4.5 Attendance Screen

Displays subject-wise attendance records for the student.

Attendance screen:

4.6 Grades Screen

Shows academic performance and grades for each subject.

Grades screen:

4.7 Announcements Screen

Announcements are categorized into multiple sections:

- All Announcements
- Important Announcements
- Events

Each category is displayed on a separate screen and connected using interactive prototyping.

Announcement category screens:

4.8 Enrollment Screen

The enrollment screen allows students to:

- Enroll in new subjects
- Drop existing subjects

HCI Principle Applied: User control and flexibility

Enrollment screen:

4.9 Fee Management Screen

This screen allows students to pay fees using two options:

- Credit Card
- Bank Transfer

Both options are fully interactive using Figma prototyping.

Payment Option Screens:

4.10 Profile Screen

The profile screen displays the student's personal and academic information.

- View profile details
- Easy access from the menu bar

Profile screen:

4.11 Logout Functionality

A logout option is available on every screen

The user can securely log out at any time

Logout option:

5. Prototyping & Interactivity

All screens are connected using Figma prototyping

Clickable buttons and smooth transitions

Logical navigation flow between screens

Prototype interaction flow:

6. Functional & Non-Functional Requirements

6.1 Functional Requirements

- The system must be able to perform the following functions:
- The system shall allow users to log in using valid credentials.
- The system shall display a login success message after successful authentication.
- The system shall allow users to access the dashboard after login.
- The system shall display enrolled courses to the user.
- The system shall show the student's timetable in a structured format.
- The system shall display subject-wise attendance records.
- The system shall show grades and academic performance.
- The system shall display announcements categorized as All, Important, and Events.
- The system shall allow students to enroll in and drop subjects.
- The system shall allow fee payment through credit card and bank transfer options.
- The system shall display student profile information.
- The system shall allow the user to log out from any screen.

6.2 Non-Functional Requirements

The system should meet the following non-functional requirements:

Usability: The interface should be easy to use and understand.

Consistency: Layout, colors, and navigation should be consistent across all screens.

Performance: Screen transitions should be smooth without delay.

Security: User data should be protected and login should be secure.

Accessibility: Text and buttons should be clearly visible and readable.

Reliability: The system should work correctly during normal usage.

Scalability: The design should support future features.

7. Low-Fidelity & High-Fidelity Prototypes

7.1 Low-Fidelity Prototype

Low-fidelity prototypes represent the basic structure and layout of the system.

- Simple wireframes
- Black and white layout
- Focus on navigation and screen flow

Purpose:

To understand layout and user flow

To test basic usability before detailed design

Low-fidelity wireframes:

7.2 High-Fidelity Prototype

High-fidelity prototypes represent the final detailed design.

- Designed using Figma
- Includes colors, icons, typography
- Fully interactive and clickable

Purpose:

To demonstrate final user interface

To test real user interaction and experience

7.3 High-fidelity Figma prototype screens:

8. Hierarchical Task Analysis (HTA)

9. HCI Principles Applied

Consistency: Uniform layout and navigation across all screens

Visibility: Clear labels, icons, and readable text

Feedback: Login success and action confirmations

User Control: Enrollment, profile access, and logout options

Error Prevention: Clear input fields and messages

10. Conclusion

The University Student Portal is a well-structured HCI-based UI/UX project that focuses on usability, accessibility, and interactivity. The design ensures that students can efficiently manage their academic activities with minimal effort.
